

ASSESSMENT TOOL 1 CO1

TOPIC : Application: Online Banking Fraud Detection

NAME : UDHAYAKUMAR U

REG NO : 192424332

**COURSE CODE : CSA0606 - DESIGN AND ANALYSIS
OF ALGORITHMS**

1.) A fraud detection system analyzes transactions recursively:

$$T(n)=T(n/2)+1 \quad T(n) = T(n/2) + 1 \quad T(n)=T(n/2)+1$$

Apply the Master Theorem and determine the time complexity. Identify the appropriate case and justify it. Explain how this efficiency impacts real-time fraud detection performance.

Step 1: Write the Given Recurrence Relation

The given recurrence relation is:

$$T(n) = T(n/2) + 1$$

This means:

- The problem size is reduced by half in every recursive call.
- Each recursive call performs only **constant work (1)**.

Step 2: Compare with the Master Theorem

The standard form of the Master Theorem is:

$$T(n) = aT(n/b) + f(n)$$

Compare the given recurrence with the standard form.

Given:

$$T(n) = T(n/2) + 1$$

Therefore,

- **$a = 1$**
- **$b = 2$**
- **$f(n) = 1 = \Theta(1)$**

Step 3: Find $n \log_b a^{\log_b a} n \log_b a$

Using the formula:

$$n \log_b a^{\log_b a} n \log_b a$$

Substitute the values.

$$n \log_2 1^{\log_2 1} n \log_2 1$$

Since,

$$\log_2 1 = 0 \quad \log_2 1 = 0 \quad \log_2 1 = 0$$

Therefore,

$$n 0 = 1 \quad n^0 = 1 \quad n 0 = 1$$

So,

$$n \log_b a = 1 \quad n^{\log_b a} = 1 \quad n \log_b a = 1$$

Step 4: Compare $f(n)f(n)f(n)$ with $n \log_b a^{\log_b a} n \log_b a$

We have

$$f(n) = 1 \quad f(n) = 1 \quad f(n) = 1$$

and

$$n \log_b a = 1 \quad n^{\log_b a} = 1 \quad n \log_b a = 1$$

Hence,

$$f(n) = \Theta(n \log_b a) \quad f(n) = \Theta(n^{\log_b a}) \quad f(n) = \Theta(n \log_b a)$$

Both are equal.

Step 5: Identify the Master Theorem Case

Master Theorem has three cases.

Case 1

If

$$f(n) = O(n \log^a n - \epsilon) \quad f(n) = O(n^{\log_b a - \epsilon}) \quad f(n) = O(n \log^a n - \epsilon)$$

Not satisfied.

Case 2

If

$$f(n) = \Theta(n \log^a n \log^k n) \quad f(n) = \Theta(n^{\log_b a} \log^k n) \quad f(n) = \Theta(n \log^a n)$$

Here,

$$f(n) = \Theta(1) \quad f(n) = \Theta(1) \quad f(n) = \Theta(1)$$

and

$$n \log^a n = 1 \quad n^{\log_b a} = 1 \quad n \log^a n = 1$$

Since

$$1 = \Theta(1) \quad 1 = \Theta(1) \quad 1 = \Theta(1)$$

this satisfies **Case 2** with **k = 0**.

Step 6: Apply the Formula

For **Master Theorem Case 2**

$$T(n) = \Theta(n \log b \log^{k+1} n) \quad T(n) = \Theta(n^{\log_b a} \log^{k+1} n) \quad T(n) = \Theta(n \log \log^{k+1} n)$$

Here,

- $n \log b a = 1 \quad n^{\log_b a} = 1 \quad n \log b a = 1$
- $k = 0 \quad k = 0 \quad k = 0$

Therefore,

$$T(n) = \Theta(1 \times \log n) \quad T(n) = \Theta(1 \times \log n) \quad T(n) = \Theta(1 \times \log n)$$

Hence,

$$T(n) = \Theta(\log n) \quad \boxed{T(n) = \Theta(\log n)} \quad T(n) = \Theta(\log n)$$

Step 7: Time Complexity

$$\Theta(\log n) \quad \boxed{\Theta(\log n)} \quad \Theta(\log n)$$

The running time grows logarithmically with the input size.

Step 8: Justification

- ❖ At each recursive call, the input size is divided by **2**.
- ❖ Only **constant work (1)** is performed at each level.
- ❖ The recursion continues until the problem size becomes **1**.
- ❖ The total number of recursive levels is:

$$\log_2 n$$

Since each level performs constant work,

$$1 + 1 + 1 + \dots + 1 \text{ (}\log_2 n \text{ times)} = \log_2 n$$

Therefore,

$$T(n) = \Theta(\log n)$$

Step 9: Recursion Tree (Explanation)

Suppose $n = 16$

$T(16)$

|

v

$T(8)$

|

v

$T(4)$

|

v

$T(2)$

|

v

$T(1)$

Levels:

- Level 1 $\rightarrow T(16)$
- Level 2 $\rightarrow T(8)$
- Level 3 $\rightarrow T(4)$
- Level 4 $\rightarrow T(2)$
- Level 5 $\rightarrow T(1)$

Total levels =

$$\log_2 16 = 4 \quad \log_2 16 = 4$$

Therefore,

$$T(n) = \Theta(\log n) \quad T(n) = \Theta(\log n)$$

Step 10: Impact on Real-Time Fraud Detection

A logarithmic time complexity is highly efficient for online banking systems.

- The input size is reduced by half at every recursive step.
- Even if the number of transactions increases significantly, processing time grows very slowly.
- Fraudulent transactions can be detected quickly with low latency.
- The system can handle millions of banking transactions efficiently.
- This improves real-time fraud detection, scalability, and overall system performance.
